

GETTING STARTED GUIDE

GLP-1 Companion Planner

Your week, anchored on dose day.

SECTION ONE

Getting Started

01

Eight things worth doing in the first ten minutes. None of them take long, and they set up everything the dashboard shows you afterwards.

○ **Open the file**

Double-click the downloaded .html file. It opens in whatever browser you already use — there is nothing to install and no account to create.

○ **Bookmark it, or keep it somewhere you'll find it**

Your data is tied to the file's location on your device. Save it somewhere permanent before you start typing, then bookmark it so it is one click away each morning.

○ **Pick a palette**

Five themes sit at the bottom of the sidebar: Slate & Amber, Clay, Fern, Dusk and Ink. Click one and the whole planner recolors. Dusk and Ink are darker, for evening logging.

○ **Set your dose day and protein target**

These two answers drive the entire dashboard — the seven-day strip is anchored on your dose day, and the ring fills against your protein target. The welcome screen asks for both.

○ **Log your current dose**

Open Dose Log and add today's entry with the strength and injection site. If you have been on this a while, add your earlier steps too; the titration history builds from them.

○ **Fill in one full day**

Go to Daily Log and enter protein by meal. Watching the ring close is the fastest way to learn what your target actually looks like on a plate.

○ **Take your starting measurements**

Measurements is weekly, not daily. Enter today's numbers now so that every inches-lost total afterwards has something honest to count from.

○ **Save your first backup**

Press Save, choose a passphrase you will remember, and keep the downloaded file somewhere safe. That file is the only way to move your history to another device.

SECTION TWO

What's Inside

02

Twelve sections, all in the one file. Six here and six on the next page.

DASHBOARD Your week at a glance. A seven-day strip anchored on your dose day shows what has been logged and what hasn't, alongside your protein ring, days since your last dose, current dose strength, your latest non-scale victory, and symptom severity by day since dose.

MY DETAILS The handful of facts everything else is built on — name, start date, dose day, daily protein target, starting and goal weight, and your prescriber's details. Saves as you type.

DOSE LOG What you took and when: date, strength and injection site. Rotating your site is standard practice, so the site column saves you having to remember which one you used last.

DAILY LOG Protein first, then everything else. Protein by meal fills a ring toward your target as you type, with water, fiber, and ticks for the things easy to lose track of.

HOW IT SAT Log a food once and mark it Sat well, Hit or miss, or Rough. The planner sorts it into the matching card on its own, so the pattern surfaces without you holding it in your head.

SYMPTOMS Charted against days since your dose rather than the calendar — the view that actually shows a rhythm. The planner works out the dose day for you and names your worst day.

SECTION TWO

What's Inside — continued

The record that keeps going on the weeks the scale doesn't.

MEASUREMENTS	Weekly, not daily. Waist, hips, chest, arm and thigh sit beside weight, with running totals for inches lost — the record that keeps going while the scale stalls.
---------------------	---

STRENGTH	Losing weight costs muscle unless you give your body a reason to keep it. Log the session and the loads; the planner counts your sessions per week against a two-a-week target.
-----------------	---

NON-SCALE VICTORIES	What is actually changing while the scale refuses to move. Each entry is dated, and a rotating prompt is there for the days when nothing comes to mind.
----------------------------	---

QUESTIONS FOR MY PROVIDER	The thing you meant to ask and forgot the moment you sat down. Write it when it occurs to you, tick it off once answered, and print the page before your appointment.
----------------------------------	---

REFILLS & COSTS	Refill dates, prior-authorization status, and what this is costing month to month. The dashboard surfaces the next refill still ahead of you and totals what you have spent.
----------------------------	--

CHECKLIST	Organized by treatment stage rather than by month, because people start this at very different points and move at very different speeds. Add your own items to any stage.
------------------	---

SECTION THREE

Using the Daily Log

03

The Daily Log is where most of your minutes will go, and it is built around one idea: protein first, then everything else.

○ Start with protein, not calories

The Daily Log deliberately has no calorie field. On a GLP-1 you get full fast, so whatever you eat first is what actually lands — and protein is the thing worth protecting. Enter grams for breakfast, lunch, dinner and snack.

○ Watch the ring rather than the numbers

The ring in the centre fills against the daily target you set in My Details. It updates as you type, so you can see before dinner whether the day is going to land or fall short — which is the only moment the information is still useful.

○ Tick the four habits

Moved my body, ate slowly, strength session, took my dose. They take a second each and they are what the dashboard's weekly strip is counting. Taking your dose ticks here as well as in the Dose Log.

○ Water and fiber sit alongside

Both are common trouble spots on a GLP-1 and both are easy to forget. They have their own small fields rather than a section of their own, because they belong to the day, not to a separate project.

○ Write the one line you'll want later

The notes field at the bottom is the part people are gladdest to have months in. Energy, appetite, anything that surprised you. One sentence is enough.

○ Move between days freely

The arrows step backwards and forwards; Today jumps straight back. Filling in yesterday evening is normal and the planner does not penalise it — nothing here is a streak you can break.

SECTION FOUR

Saving, Restoring & Sharing

Your records stay on your own device. Here is exactly how that works, and how to move them when you need to.

- **Everything saves as you type**

There is no Save-before-you-close step for normal use. The planner writes to your own browser storage on every keystroke, on your device only.

- **Save makes an encrypted backup file**

Press Save and the planner asks for a passphrase, then downloads a single encrypted file. The encryption is done by your own browser using AES-256 — the file is unreadable without the passphrase, so a backup left on a shared computer or sent over email stays private.

- **One backup covers everyone**

If two of you are using this planner, a single backup holds both records under one passphrase, and Restore brings both back. Profiles keep your records separate from each other; they are not a lock between the two of you.

- **There is no unencrypted export**

This is deliberate. A planner holding dose history and symptoms should not be able to produce a plain-text copy of itself by accident.

SECTION FOUR

Saving, Restoring & Sharing — continued

Moving your records, and the one habit worth keeping.

○ **Restore brings it back anywhere**

Open the planner on the new device, press Restore, choose the backup file and enter the passphrase. Everything returns exactly as you left it, including your palette.

○ **Your passphrase cannot be recovered**

Not by us and not by anyone else — there is no server holding a copy. Choose something you will remember, and use the hint field, which is stored unencrypted for exactly this reason.

○ **Share and Print**

Print outputs the section you are currently on, cleanly, without navigation or buttons. Questions for My Provider and Dose Log are the two worth taking to an appointment.

- *Save a backup the day before each provider appointment. It takes ten seconds, and it means the version of your history you discussed is preserved exactly as it was on the day.*

SECTION FIVE

Frequently Asked Questions

The questions that come up most often.

Do I need an account or a subscription?

No. Nothing to sign up for and nothing to renew. You download one file and open it.

Where does my data actually go?

Onto your own device only. The planner has no server behind it and sends nothing anywhere. Backups are files you save yourself, encrypted with a passphrase you choose.

Which browsers does it work in?

Chrome, Safari, Firefox and Edge, updated within the last couple of years. The encryption uses your browser's built-in Web Crypto, which all four have supported for years.

Does it work on my phone?

Yes. The layout adapts to phone screens and a menu button replaces the sidebar.

Do I need to be online?

Only the first time you open it, so the fonts can load. After that it runs offline.

Can I print it?

Yes — any single section, on its own, without the navigation or buttons.

Can I use it for more than one person?

Yes. Open My Details and choose Add a second person. A partner also on a GLP-1 gets their own dose day, protein target and full history, kept separately in this same file, and a switcher appears in the header once there are two of you. Saving a second copy of the file is not a substitute — copies share the same saved data and would overwrite each other.

What if I lose my passphrase?

The backup file cannot be opened without it. Your live data on the original device is unaffected — set a new passphrase and save a fresh backup.

Can I resell or share this file?

No. It is licensed for personal use by the buyer. Please point friends at the listing rather than passing the file on.

Is this medical advice?

No. It is a private record-keeping tool. It does not provide dosing guidance or treatment recommendations — always follow your own prescriber's instructions.
